Movie/Music Compromiser

Benjamin Gur CSCI Capstone 2/3/2020

Large group can't decide what to watch

Long road trip everyone hates each other's music

App/site that takes user preferences and determines the movie or music with the largest degree of contentedness or overall positive decision. And can give a selection for the group to choose from.

How is this different?

Currently while sites like Netflix, Hulu, and Spotify can give you a selection to pick from based on an algorithm, they only apply to individual platform and to a single user this would be truly global and one stop shop.

Technicals

This can be made possible because most existing platforms have strong apis which will allow us to get the data to create an algorithm to get a best fit for all users. User bias's can be stored on a SQL database or similar and be accessed from a mobile and/or web based front end.
